CR64 Candlestick Phone

The Candlestick phone, also known as the 'upright', initially became popular during the early 1900's before the introduction of the one-piece handset. The first Candlestick phones were introduced when the magneto system was in use, which meant that the phone was connected to a large wooden box called a "subset" containing a battery, bell, and crank. But oh how we have come a long way. From its bell-shaped mouthpiece to its cloth covered receiver cord, this telephone replica recalls a vintage instrument from the 1900's. But a closer look reveals some modern technology including a decorative dial that functions as a push button for tone/pulse operation as well as a center medallion that serves as a redial button. This modern day version of the Candlestick phone would have surely made Alexander Graham Bell proud.
