

Sink Mounting Bar Kit Installation Guide

Item: RMUM

The sink mounting bars will be installed directly into your cabinetry horizontally under your sink.

1. Measure the distance between the cabinets where you will be installing your sink.
2. Cut the mounting bars to the correct length.
3. Measure the outside height of the sink to determine how far into the cabinet the mounting bars will need to be placed.
4. Install the mounting bar flanges with the curve end level on the bottom at the desired location using screws that are appropriate for your particular installation. Typical wood screws are included for your convenience.
5. Place the rods into the flanges.

Note: Due to the handmade nature of fireclay sinks, slight variances are normal and all sinks will not be level.

6. Place the sink on installed mounting bars.
7. If fit and finish are not acceptable, adjust mounting bars accordingly.
